

Uniform Survey Log Combining MWD and Gyro

APPLICATION

The MWD + Gyro service will statistically combine MWD and Gyro into a single survey. The service will identify/fix declination error and correct out of spec IFR/HDGM/BGGM reference field values. Operationally, if a Gyro is run on any well on a pad to a minimum of 200 ft into the lateral, the declination improvement can be shared with the rest of the surrounding wells. MWD + Gyro will improve wellbore accuracy and reduce positional uncertainty.

MWD+Gyro Identified 0.28° of Declination Error Resulting in 118' of Positional Improvement

FEATURES

- Declination Error Identification and Removal
- RIP Test Included as Part of Assessment
- Pad-Level Solution

BENEFITS

- Most Precise MWD EOU Available on the Market
- Improve Anti-Collision Scans and Reduce Lease Line Spacing Infringement
- Available in Real-Time or Post-Well
